HSF302 - Spring Security 6 Architecture & BCrypt Password Hashing - Page 1

Chapter 1: Spring Security Filter Chain and Authentication Architecture
Spring Security operates through a series of servlet filters known as the SecurityFilterChain.
When an HTTP request enters the web application, it passes through security filters including SecurityContextHolderFilter, CsrfFilter, and UsernamePasswordAuthenticationFilter.
AuthenticationProvider validates user credentials using UserDetailsService and BCryptPasswordEncoder.
Session management handles JSESSIONID cookie creation and persists authentication in the HttpSession.
